SYSTEM FEATURES

- Variables

• Design Tokens

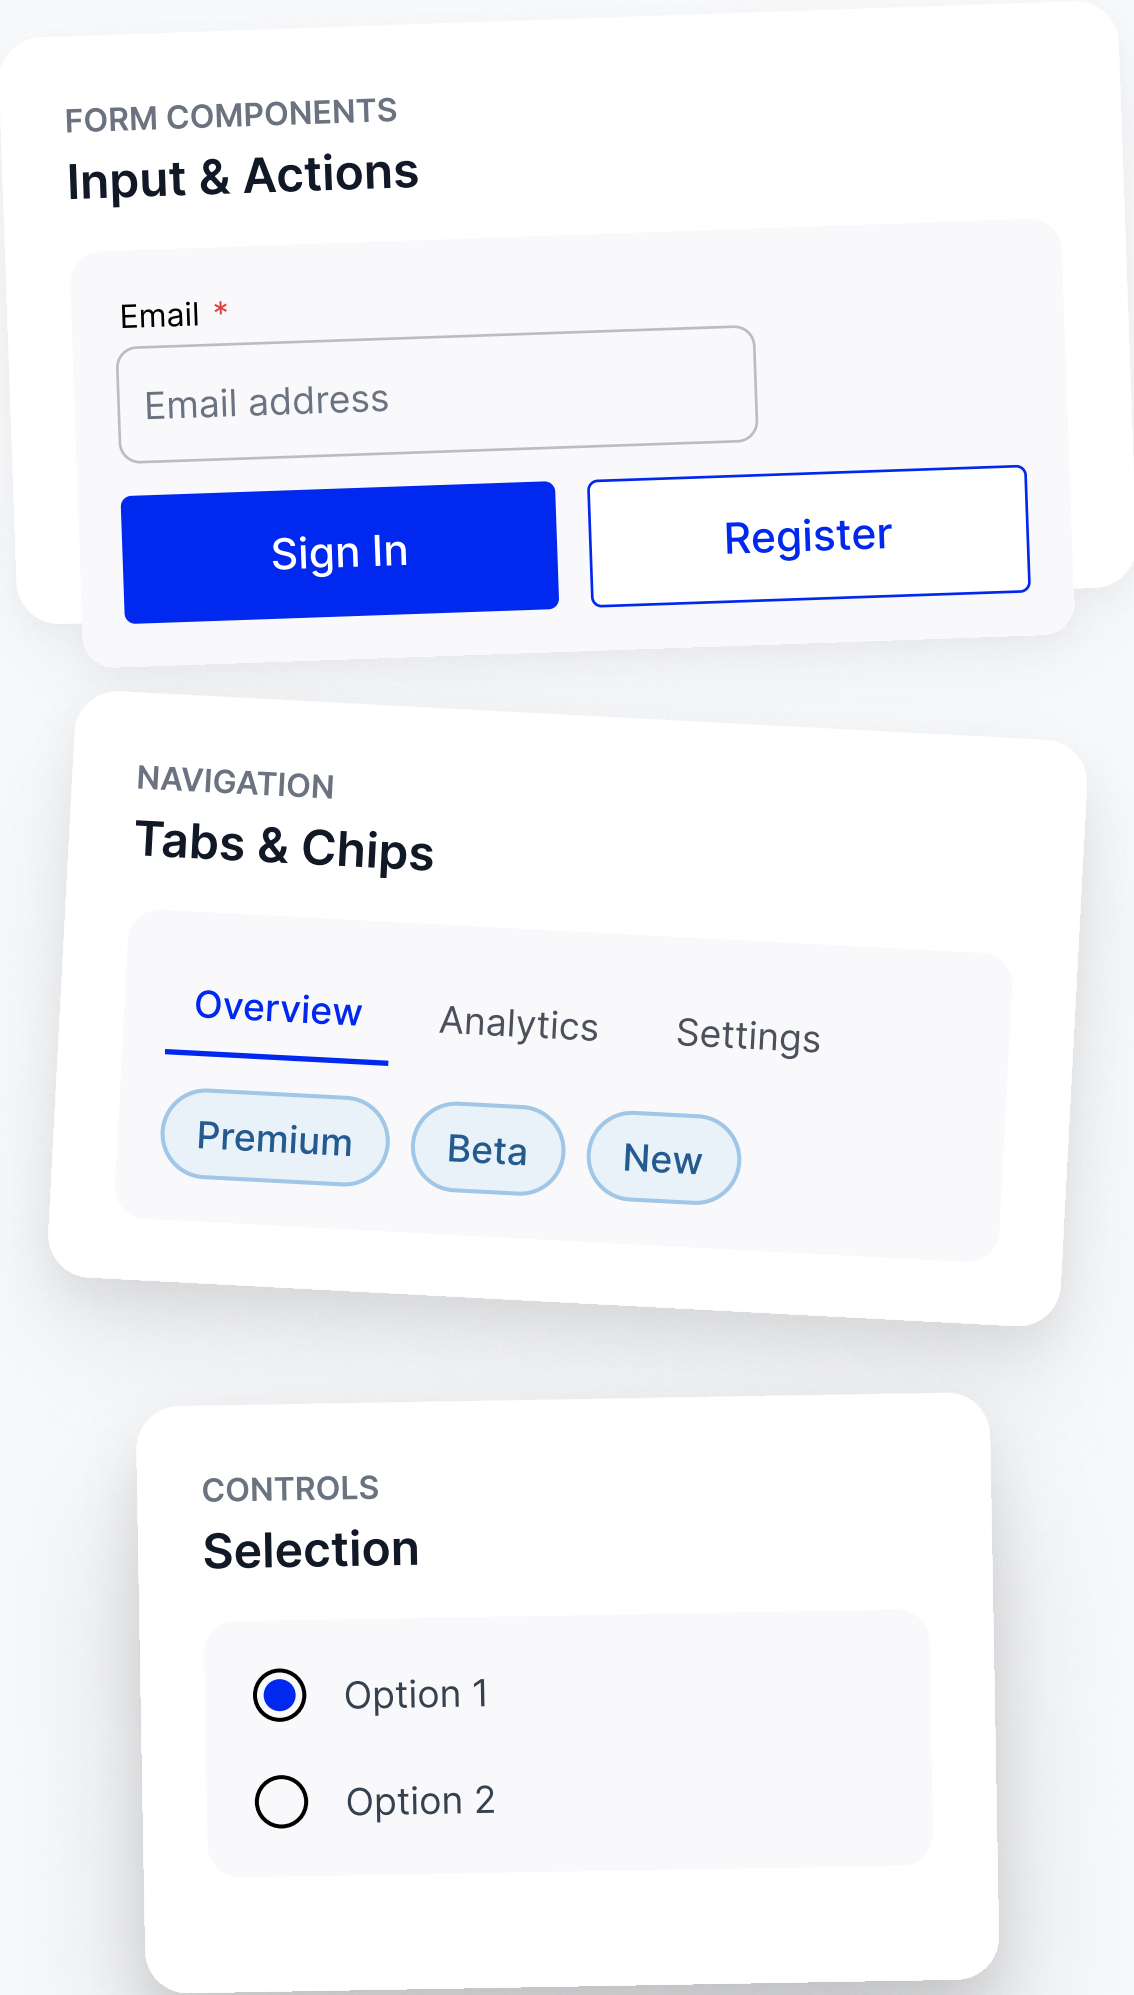

• Auto Layout

• Component Properties

• Interactive Components
- Design Libraries

• Responsive Components

• Developer Ready

Designed as a scalable enterprise design system to support multiple products, reusable workflows and consistent developer implementation.

Token Architecture

A three-tier variable system powering consistent, scalable theming across different themes, modes, and product platforms.

Primitive Tokens

65 primitives

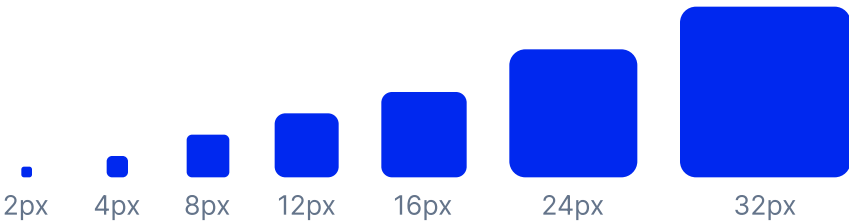

Semantic Tokens

70 semantic tokens

Foundation Tokens

31 spacing & sizing tokens

Built for Scale

Enterprise-grade token architecture designed to power scalable cross-product alignment for global product teams.

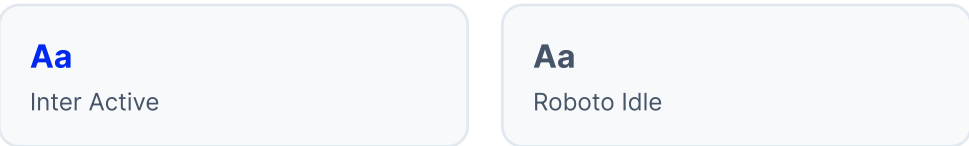

Auto Layout Mastery

Every component is configured utilizing Auto Layout with explicit padding, spacing constraints, and fluid fill-parent dimensions to adapt across screen sizes.

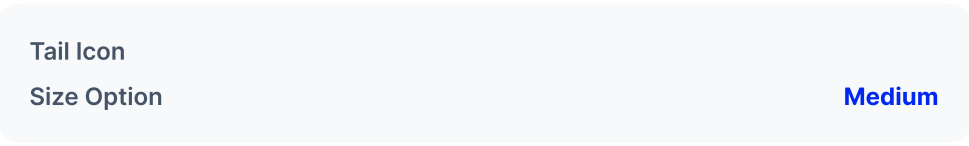

Multi-Mode Theming

Switch between font systems and spacing maps gracefully. Token abstract levels ensure layouts retain geometric balance under any configuration.

Component Properties

Boolean controls, content-based slots, and variable-driven instance swapping empower engineers to customize modules without breaking layout inheritance rules.
