

Understanding the Business

What does the business do?

The platform connects enterprise organizations with qualified interpreters and translators through a centralized marketplace. Clients can request language services across multiple channels, while the platform manages booking, scheduling, compliance, service delivery, and payments.

Primary User Groups

Staff	Enterprise Clients	Linguists
Manage operations, bookings, payments and compliance	Request language services for their customers	Attend Assignments, deliver services and receive payments.

Type of Services Available

Service	Description	Booking
VRI	Video Interpreting	On-demand & Scheduled
TI	Telephone Interpreting	On-demand
F2F	In-person Interpreting	Scheduled
Translation	Document translation	Scheduled

Design Objective

Design a unified mobile application for linguists by consolidating the existing Mobile App A and Mobile App B into a single experience, while keeping the Staff and Client platforms unchanged.

Key Insight

Although the platform serves multiple stakeholders, the success of this exercise depends on improving the end-to-end workflow of the linguist, who is the most operationally active user.

Current Product Ecosystem

Current Product Landscape

Current Linguist Journey

Fragmented Experience

Journey Step	App
Set Availability	●————→App B
Receive Job Offer	●————→App A / B
Review Job Details	●————→App A / B
Accept / Decline	●————→App A / B
VRI	●————→App B
TI	●————→App B
F2F	●————→App A
Translation	●————→App A
Complete Job Sheet	●————→App A
Track Remittance	●————→App A

Key Insight

The linguist completes one continuous workflow, but the current experience is fragmented across two applications, increasing context switching and cognitive effort.

Pain Points

Workflow Fragmentation

Pain Point

A single end-to-end workflow is split across two mobile applications

Impact

Users must remember where each task is performed, interrupting task continuity.

Context Switching

Pain Point

Linguists frequently switch between App A and App B while completing related tasks.

Impact

Increased mental effort and reduced efficiency during daily operations.

Inconsistent Experience

Pain Point

Similar tasks are distributed across different applications with different navigation patterns.

Impact

Longer learning curve and inconsistent user experience.

Operational Complexity

Pain Point

Availability, communication, service execution, and post-service activities are managed across multiple touchpoints.

Impact

Higher chances of missed actions, confusion, and operational friction.

Key Insight

The current ecosystem supports all required business capabilities, but the fragmented mobile experience increases cognitive load and operational effort for linguists.

Design Objectives

Unified Experience

Consolidate Mobile App A and Mobile App B into a single, seamless application.

Simplified Navigation

Reduce context switching by providing one consistent navigation system across all services.

Task Efficiency

Enable linguists to complete their daily workflow with fewer steps and less cognitive effort.

Service Flexibility

Support VRI, TI, F2F, and Translation services within one adaptive application.

Better Availability Management

Provide a centralized experience for availability, job management, and service execution.

Scalable Foundation

Create an information architecture that supports future services without introducing additional applications.

Key Insight

Create a unified, intuitive, and scalable mobile experience that enables linguists to manage their complete workday from a single application.

Proposed Information Architecture

Key Improvement

Instead of separating functionality across two applications, all core linguist activities are organized into one intuitive information architecture, enabling linguists to complete their work from a single unified application.

Solution Overview

Unified Linguist App

Key Insight

The solution consolidates all linguist workflows into a single unified application, replacing the fragmented two-app experience with a streamlined flow: Dashboard → Jobs → Session → Job Sheet → Payments.
